

# Single-Instance Multi-Site Motivations

## Shared Environment

Consolidate Hardware and System Maintenance

## Pooled Licensing

Share License Elements and Concurrent Users

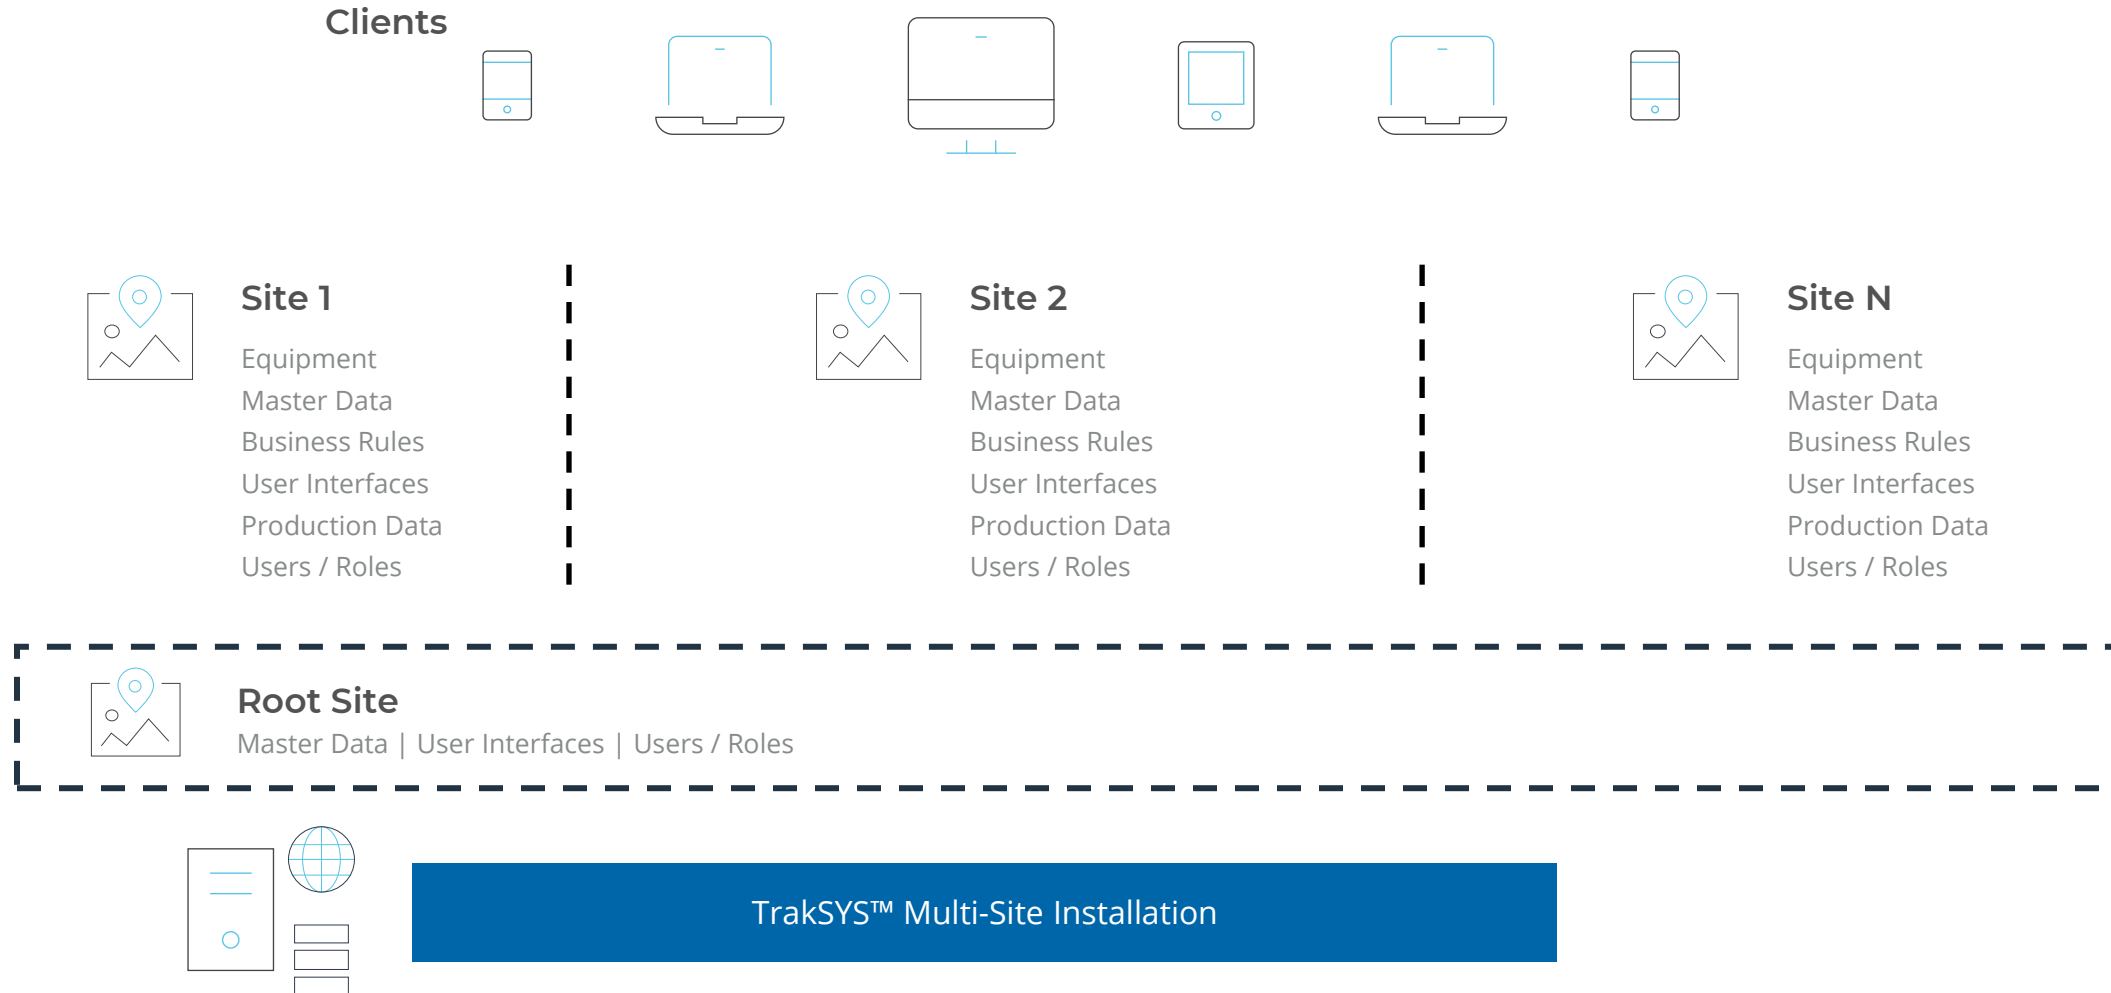

## Standardization

Unify Updates, Upgrades and Implementation Philosophy

## Common Content

Deploy and Maintain shared Configuration and UIs

# Single-Instance Multi-Site Site Segregation

# Single-Instance Multi-Site Root Site

## What is the Root Site?

The **Root Site** contains optional shared / common configuration and behaviors that can be used across all Sites configured within the SIMS.

## Master Data

- Materials
- Categories
- Locations
- Notifications
- Custom Properties
- Users / Roles / Permissions

## Business Rules

- Script Libraries
- Workflow Processes
- DMS Modules

## User Interfaces

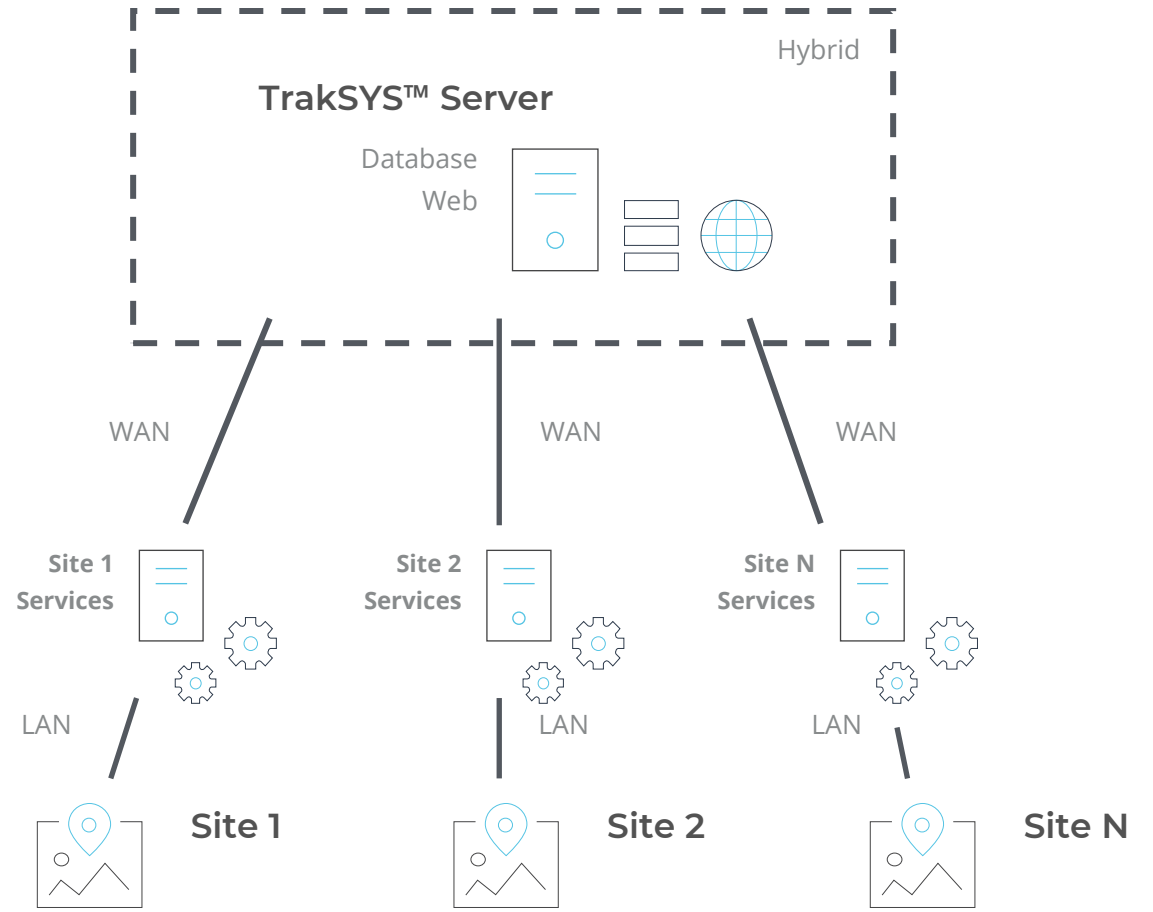

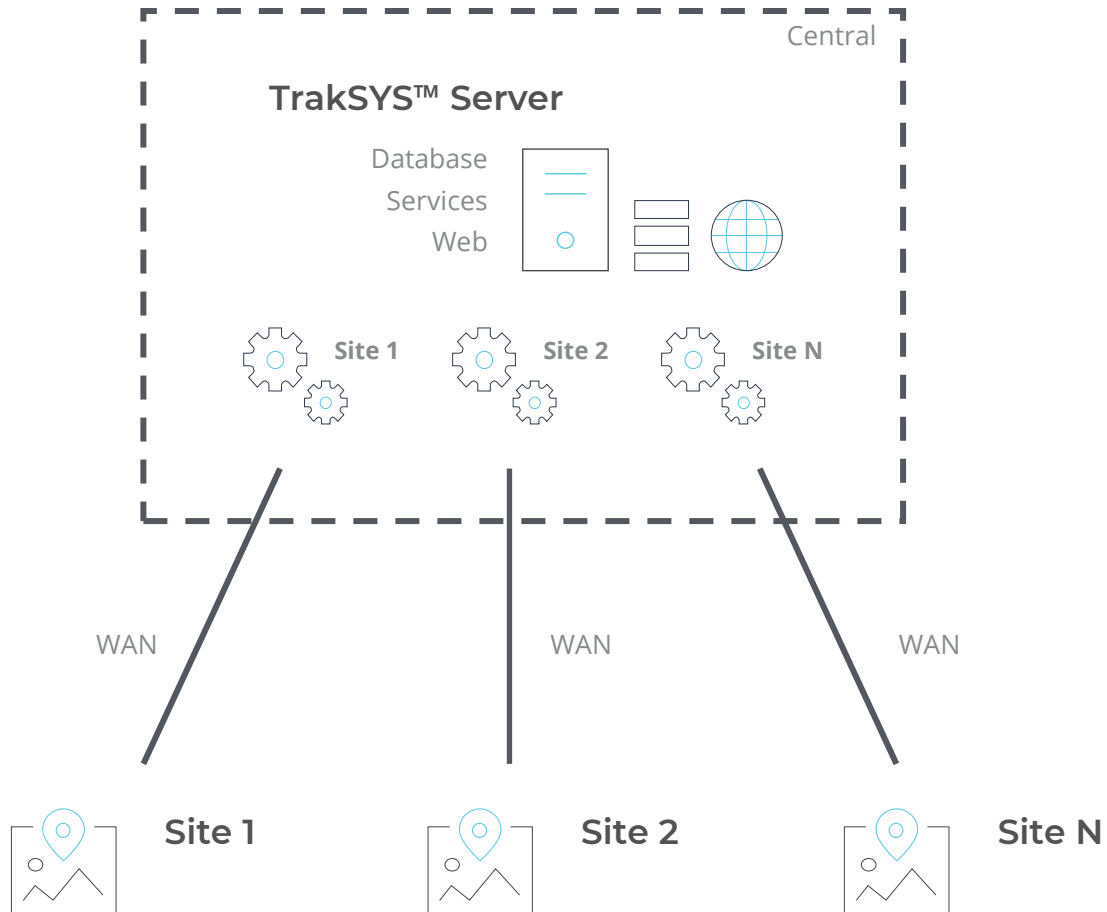

- Content Parts
- Content Pages

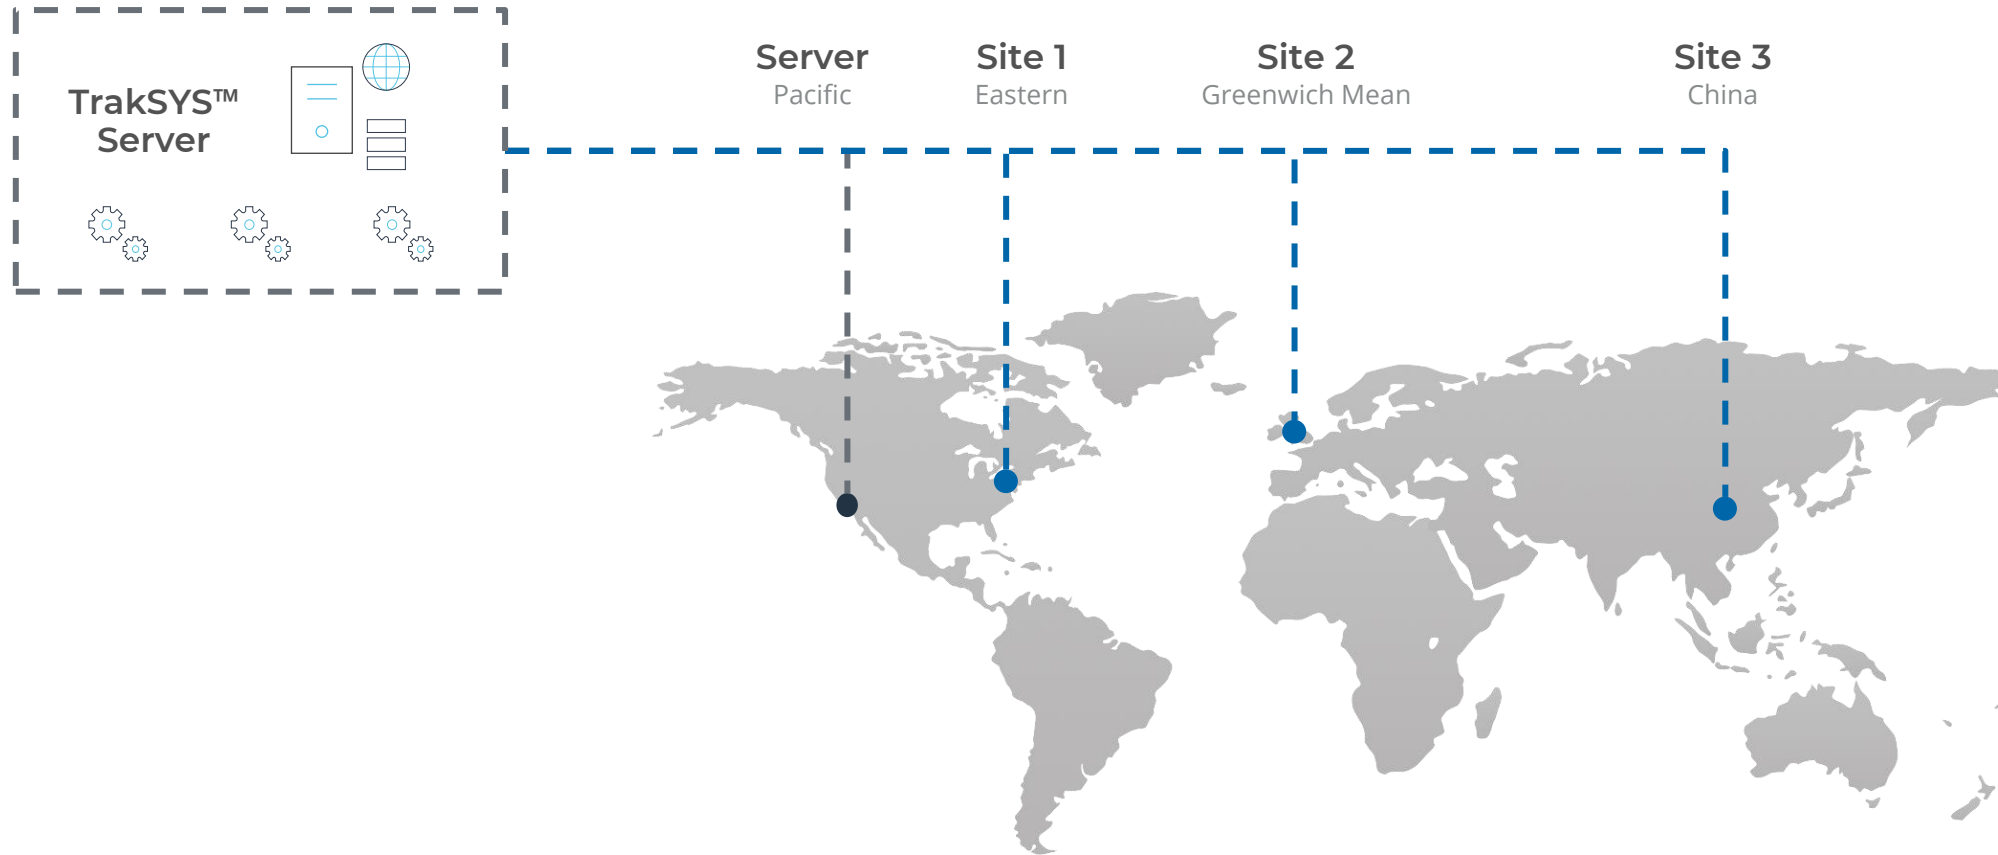

## Aggregate Reporting

Central historical reporting and dashboards that combine data from all configured SIMS Sites.

# Single-Instance Multi-Site Architectures

# Single-Instance Multi-Site Time Zones

# Single-Instance Multi-Site Considerations

## Server Load

While data collection Services can be distributed, the database and web server are shared.

## Remote Communication

Network visibility/ports must be open and accessible between local automation devices and client browsers.

## Speed and Availability

Network speeds and connection availability must be adequate for the application requirements.

## Governance

A clear plan should be in place for who manages system upgrades, support renewals, and other global decisions.

## Upgrades and Maintenance

Any system maintenance or upgrades will affect all Sites housed within the shared implementation.
